

if you are using any column that is saving date or time using **timestamps()** or you are inserting / updating time from query. Then you might have problem of timezone. Your hours maybe storing ahead or back of your computer machine. So how you will solve it ?

Here is a solution to set your current timezone in laravel

You can set the timezone in your **config/app.php** file, for instance if you are in india (your timezone) you should do this:

```
'timezone' => 'Asia/Kolkata',
```

you can change this timezone according to you or your client's residence. For a full list of supported timezones in php please follow this link <http://php.net/manual/en/timezones.asia.php>
