

previously I was using the following script in PHP 5.5.9 to unset all variables, which was working very well

```
$vars = array_keys(get_defined_vars());
for ($i = 0; $i < sizeof($vars); $i++) {
    unset($vars[$i]); //this is line 72
}
unset($vars, $i);
```

but now when i used same code in PHP 7 , this is giving following messages:

```
PHP Notice: Array to string conversion in /root/script.php on line 72
PHP Notice: Undefined variable: Array in /root/script.php on line 72
```

after reading php 7 documentations and some research on internet i found that i have to use foreach instead of for

```
$vars = array_keys(get_defined_vars());
foreach ($vars as $var) {
    unset($var);
}
unset($vars, $var);
```

The order of evaluation of `unset($vars[$i])` is [different in PHP 7](#). It's now strictly left to right.

Previously it would have first evaluated `$vars[$i]` and then formed a new variable from the result of that with `$`.

Now it first evaluates `unset($vars)` and then tries to find `[$i]` in the result of that.
